DATA ANALYTICS CAREER TRACK

The 90-Day Data Analyst Roadmap

A day-by-day plan for a final-year CS student: SQL, Python, Power BI and Tableau in two focused hours a day, three portfolio projects, and your first freelance income within ninety days.

For final-year CS students entering data

SQL · Python · Power BI · Tableau · Fiverr · Upwork

NOVEMBER 2026 · 2 HOURS A DAY · START TODAY

Table of Contents

1. Your Track and Your Title **1**

2. How This Plan Works **3**

3. Phase 1 - Foundations (Weeks 1-4) **5**

3.1 Week 1 - SQL Foundations 5

3.2 Week 2 - Advanced SQL and Practice Platforms 6

3.3 Week 3 - Python for Analysts 7

3.4 Week 4 - Data Cleaning - Your First Real Project 7

4. Phase 2 - Analyst Toolkit (Weeks 5-8) **8**

4.5 Week 5 - Statistics That Actually Matter 8

4.6 Week 6 - EDA and Visualization in Python 9

4.7 Week 7 - Power BI I - From CSV to Dashboard 10

4.8 Week 8 - Power BI II, Excel, and Project 1 Complete 10

5. Phase 3 - Portfolio and Income Launch (Weeks 9-12) **11**

5.9 Week 9 - Project 2 and Profile Polish 11

5.10 Week 10 - Freelance Launch Week (Fiverr + Upwork) 12

5.11 Week 11 - Kaggle and Tableau Week 13

5.12 Week 12 - Applications and Interview Prep 13

6. Freelance Launch Kit: Fiverr and Upwork **14**

7. The AI Shortcut Library **16**

8. Bonus Track: The BI Developer Combo (React + Data) **18**

9. Tracking, Milestones and Life After Day 90 **19**

1. Your Track and Your Title

Before opening a single tutorial, you need to know the exact name of the door you are walking toward, because job titles decide which job postings you match. The honest name for your path is the Data Analytics track: you enter as a Data Analyst, you grow into a BI Developer or Analytics Engineer, and only later - if you enjoy it and want it - you move toward Data Science. This chapter also settles the salary and market question with real numbers, and shows why your React and Node background is not wasted time but a genuine advantage.

Table 1: The career ladder and what each rung pays

Stage	Proper title	What you actually do	Typical pay in Pakistan (2026, estimate)
Today (day 0)	Final-year CS student moving into data	Learning SQL, Python and BI tools; no paid experience yet	-
Day 90	Entry Data Analyst / freelance Data Analyst and Dashboard Specialist	Cleaning data, SQL queries, Excel work, Power BI dashboards, small scraping jobs	Internship PKR 25,000-60,000/mo; first freelance orders USD 20-150/mo
1-2 years	Data Analyst / Junior BI Developer	Owning reports, building dashboards, writing DAX measures and SQL models	PKR 50,000-100,000/mo junior analyst
2-4 years	BI Developer / Analytics Engineer	Data models, pipelines, dashboard systems, stakeholder reporting	PKR 100,000-180,000/mo
3-5 years (optional)	Data Scientist / ML Engineer	Experiments, forecasting, machine learning products	PKR 200,000+/mo

Salary figures are typical ranges compiled from 2026 Pakistan salary guides and freelance market observations. Treat them as planning estimates, not guarantees - your portfolio and interview performance move you inside (or outside) these bands.

What to call yourself today matters as much as the ladder. On LinkedIn use: Aspiring Data Analyst | SQL, Python, Power BI | Final-Year CS Student. On Fiverr and Upwork use: Data Analyst and Dashboard Specialist (SQL, Python, Power BI). On your CV use: CS Graduate - Data Analytics Focus. Do not call yourself a Data Scientist yet: recruiters filter for degrees and years of experience behind that word, and it gets fresh CVs ignored. Analyst titles match you with roles you can actually win.

1.1 The market, honestly

The demand is real: the U.S. Bureau of Labor Statistics projects data-scientist employment to grow about 34 percent by 2034, and 2026 hiring analyses put overall analyst demand growth at 30-40 percent year over year. Pakistan mirrors this - banks, fintechs, telcos and software houses all post analyst and BI roles continuously. But there is an uncomfortable detail: only roughly 15 percent of analyst openings are truly entry-level, so the junior gate is the most crowded part of the market. Certificates alone will not push you through it.

+34%	~15%	PKR 50-100k
Projected growth of data-scientist jobs in the US by 2034 (BLS)	Share of analyst openings that are truly entry-level (2026 hiring data)	Typical junior data analyst monthly salary in Pakistan

The winning strategy for someone with zero job experience is therefore not a longer certificate list - it is visible proof plus volume: three solid portfolio projects that any recruiter can open in two clicks, plus dozens of freelance proposals and job applications per week. That is exactly what this 90-day plan manufactures, day by day. You will also notice the plan targets freelance income earlier than job income, because freelance gates (a good profile and persistent proposals) open faster than HR gates.

1.2 Why your React and Node background is a weapon

Most analysts cannot build a web application, and most web developers cannot model data. You sit in the rare middle: by day 90 you will have SQL, Python, Power BI and Tableau on top of React, Node and MySQL. That combination is the job description of a BI Developer - someone who builds both the data layer and the interface around it. Chapter 8 turns this into a concrete bonus project: a React dashboard fed by your own Python API. It also upgrades your FYP story: instead of apologizing for a non-standard final-year project, you present it as the web layer of your toolkit and show two data projects that prove your analytics skills.

1.3 The honest math of two hours a day

Two hours a day for 90 days is at most 180 study hours; with missed days, plan for 150-170. That is enough to reach solid junior-analyst entry level on the tool belt (SQL, Python, Power BI, Tableau) and to launch freelance profiles - it is not enough to master machine learning, and this plan deliberately skips heavy theory. Income arrives in stages: tiny freelance orders around month 3-4, steadier part-time income around month 6, and a realistic USD 300-2,200 monthly band by month 12 if you keep pushing volume. Figure 1 shows the illustrative curve this plan is designed around; it is a scenario built from typical beginner freelance ramps, not a promise.

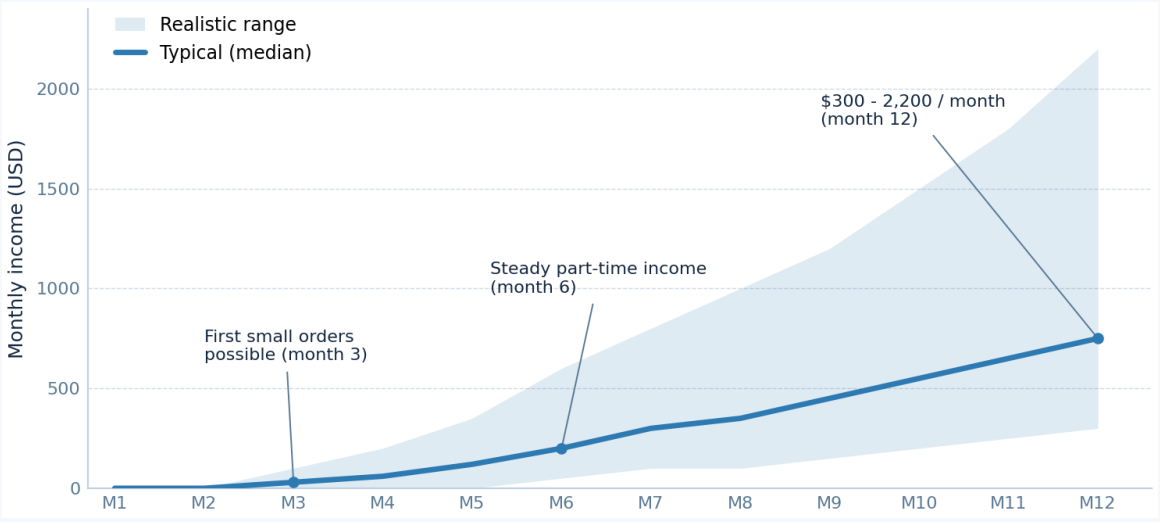

Figure 1: Illustrative income scenario for the 90-day plan and the nine months after (USD per month). Built from typical beginner freelance ramps; your results depend on consistency and proposal volume.

2. How This Plan Works

A plan you cannot execute on a tired day is a fantasy. This one is built for a final-year student juggling an FYP and classes: fixed two-hour days, a clear weekly rhythm, three phases with hard deadlines, and AI tools used deliberately as accelerators - never as substitutes. Read this chapter once carefully, then let the weekly tables in Chapters 3-5 run your life for ninety days.

2.1 The daily two-hour split

Block	Time	What happens
Learn	60 min	Course lessons, video or reading for the day's topic - actively, with your editor or notebook open
Build	45 min	Hands-on practice on today's topic, or work on the active portfolio project
Log and review	15 min	Write 3-5 lines: what clicked, what broke, one question for tomorrow; run the AI review prompt

Run six study days per week and keep day seven light: 60-90 minutes of review, catching up on anything missed, and publishing the week's work (pushing to GitHub, a short LinkedIn post). If you miss a weekday, the light day absorbs it - never let a backlog grow beyond one day, because backlog is where 90-day plans go to die. Study at a fixed time; decisions drain willpower, schedules do not.

2.2 The three phases

Phase 1 (weeks 1-4) builds the foundation: SQL first because it is the highest-return skill in every analyst job description, then just enough Python to clean data. Phase 2 (weeks 5-8) adds the analyst toolkit: practical statistics, exploratory analysis, Power BI and Excel, ending with your first end-to-end portfolio project. Phase 3 (weeks 9-12) converts skill into proof and income: a second project, live Fiverr and Upwork profiles, Tableau for breadth, a Kaggle submission, and a wave of job applications. Figure 2 shows the map.

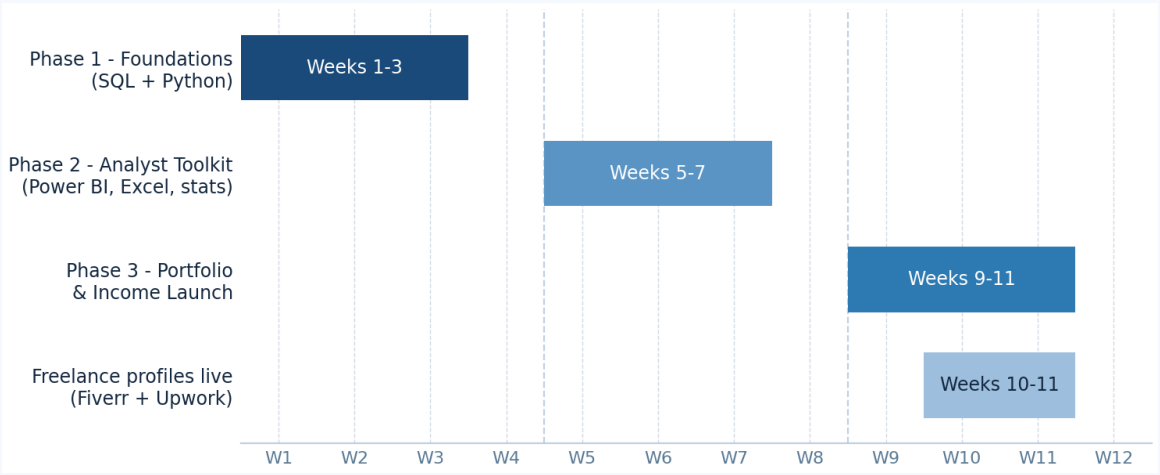

Figure 2: The 12-week map - three learning phases plus the freelance ramp that starts in week 10.

2.3 Five iron rules

1. Portfolio beats certificates. Nobody was hired for finishing videos; people are hired for visible work. Every week must end with something a stranger can open.

2. Ship something small every week. A solved-problem repo, a notebook, a dashboard page - small and finished beats big and abandoned.

3. AI is your tutor, not your substitute. The golden rule: AI explains, you re-do. Anything AI writes for you, you rebuild from memory within 24 hours.

4. Analyst math is 80 percent SQL and BI, 20 percent theory. Skip proofs, calculus and heavy ML for ninety days; they are not on the junior-analyst exam.

5. Work in public. GitHub commits and a weekly LinkedIn post are your marketing department. Silence online equals invisibility offline.

2.4 Using AI to learn faster (the meta-method)

Free AI tools - ChatGPT, Claude, Gemini, and GitHub Copilot (free for verified students through the GitHub Student Developer Pack) - can cut your learning time by a third if you use them in five specific roles. As an explainer: ask for any concept with a local example until it clicks. As a quiz master: have it test you instead of re-reading notes. As a code reviewer: paste your working code and ask a senior to tear it apart. As a dataset generator: request messy practice data instead of hunting for it. As a mock interviewer: simulate the exact interviews you fear. Chapter 7 gives you a copy-paste prompt for each role.

One warning keeps you employable: never let AI do whole assignments or project code you cannot explain. Interviews and client calls are live, and a single unexplained line of your own portfolio can end the conversation. Use AI to compress understanding, not to fake it.

3. Phase 1 - Foundations (Weeks 1-4)

Phase 1 has one obsession: make you genuinely dangerous with SQL and functionally productive with Python, then prove it with a real cleaning project. Do not chase extra courses during these four weeks - depth in the basics is what separates candidates who pass technical screens from those who collect certificates. Each week below has a goal, a day-by-day table (60 minutes learning, 45 minutes building, every day), and a checkpoint you must hit before moving on.

3.1 Week 1 - SQL Foundations

Goal: understand how relational data works and write SELECT, WHERE, GROUP BY and JOIN queries with confidence. SQL is the single most requested analyst skill, so the plan starts here, not with Python. Everything happens inside a real database you install today.

Day	Learn (60 min)	Build (45 min)	Resource / search query	AI shortcut
D1	What a database is; tables, rows, keys	Install MySQL Workbench (or DBeaver); create a test database; run your first SELECT *	sqlbolt.com lessons 1-3	Explain primary key vs foreign key using a cricket scorecard example
D2	SELECT, WHERE, ORDER BY, LIMIT	Redo SQLBolt lessons 4-6 blind, without looking	sqlbolt.com lessons 4-6	Give me 5 WHERE-clause practice questions and check my answers
D3	Aggregates: COUNT, SUM, AVG, GROUP BY, HAVING	Solve the aggregate exercises; write 5 business questions and answer them with queries	YouTube search: SQL GROUP BY tutorial for beginners	Show 3 real business questions solved with GROUP BY on an orders table
D4	JOINs: INNER and LEFT	Redo the JOIN lessons; draw the join diagrams on paper from memory	YouTube search: SQL joins explained visually	Quiz me on INNER vs LEFT join with 5 scenarios, grade my answers

Day	Learn (60 min)	Build (45 min)	Resource / search query	AI shortcut
D5	Subqueries and CASE	Rewrite yesterday's JOIN queries using subqueries and CASE	mode.com/sql-tutorial (SQL tutorial section)	I am stuck on this query: [paste]. Give one hint, not the solution
D6	Mini-project thinking	Answer 10 business questions on a sample database (Sakila or Northwind)	MySQL sample database: Sakila (dev.mysql.com/doc/sakila)	Generate 10 analyst interview questions on Sakila, easy to hard
D7	Light day: weekly review	Redo the 3 hardest queries from scratch; write a 5-line week summary	Your notes	Here are my notes: [paste]. Find the gaps in my understanding

> Day 7 deliverable: 20+ queries written from scratch, JOINs working without notes, MySQL running locally.

3.2 Week 2 - Advanced SQL and Practice Platforms

Goal: convert knowledge into interview-level speed and make your work public. This week you grind real interview questions on free platforms and start the GitHub habit that carries the rest of the plan.

Day	Learn (60 min)	Build (45 min)	Resource / search query	AI shortcut
D1	HAVING vs WHERE, NULL logic	Start LeetCode SQL 50 - easy set, first 5 problems	leetcode.com/studyplan/top-sql-50 (free)	Explain HAVING vs WHERE with two examples of each
D2	JOIN interview patterns	LeetCode SQL 50: all easy JOIN problems	Same study plan	My answer fails this test case: [paste]. Give a hint, not the fix
D3	String and date functions	Solve 4 free questions using string and date functions	stratascratch.com (free tier questions)	List the 10 date functions every analyst must know, with one example each
D4	Window functions: ROW_NUMBER, RANK	Learn the concept; solve 2 guided problems	YouTube search: SQL window functions tutorial	Explain ROW_NUMBER vs RANK vs DENSE_RANK with a marks-sheet example
D5	CTEs and cleaner queries	Rewrite three old queries using CTEs; compare readability	Same as D3-D4	Refactor my query: [paste] - and explain why your version is better
D6	Timed practice	Solve 5+ problems against the clock	hackerrank.com/domains/sql (SQL badge track)	Give me a timed mock: 5 SQL questions in 30 minutes, then grade me
D7	Light day: publish	Create your GitHub account; push solutions with a clean README	github.com	Write a clean README for my SQL practice repo from this file list: [paste]

> Day 14 deliverable: 25-30 solved problems public on GitHub and the HackerRank SQL (Basic) badge earned.

3.3 Week 3 - Python for Analysts

Goal: just enough Python to be dangerous with data - syntax, containers, loops, functions, then pandas for loading, filtering and summarizing. You are not becoming a software engineer; you are becoming someone who can clean any CSV by Friday.

Day	Learn (60 min)	Build (45 min)	Resource / search query	AI shortcut
D1	Setup + syntax basics	Open Google Colab or Jupyter; run your first notebook cells	kaggle.com/learn/python (course 1)	Explain lists vs dictionaries using a phone-contacts example
D2	Conditions and loops	Kaggle Python lessons + write 5 loop exercises	Same course	Give me 5 loop exercises themed on shop sales, then check my answers
D3	Functions and errors	Write your own functions; read tracebacks deliberately	Same course	Explain this error like I am a beginner: [paste error]
D4	pandas intro: DataFrame and read_csv	Load a CSV; run head, info, describe	kaggle.com/learn/pandas (lessons 1-2)	Explain DataFrame vs Series in words a 15-year-old gets
D5	Filtering: loc, iloc, boolean masks	10 filtering questions on the Titanic dataset	kaggle.com - Titanic dataset	Generate 10 filtering questions on Titanic, easy to hard
D6	GroupBy and new columns	Build 3 summary tables; create 2 derived columns	Same course	Review my notebook code: [paste] - what would a senior analyst fix?
D7	Light day: first EDA look	One mini exploration notebook on one dataset; push to GitHub	github.com	Here are my summary outputs: [paste]. Write 5 insights a manager understands

> Day 21 deliverable: one public notebook called Titanic first look on your GitHub.

3.4 Week 4 - Data Cleaning - Your First Real Project

Goal: experience what analysts actually do all day: take messy, broken data and make it trustworthy. You will clean a real Pakistani dataset end to end and publish it - this repo becomes the first item on your CV.

Day	Learn (60 min)	Build (45 min)	Resource / search query	AI shortcut
D1	Missing values: isnull, fillna, dropna	Apply all three strategies on a messy dataset; note consequences	kaggle.com/learn/pandas (final lessons)	When should I drop vs fill missing values in business data? Give decision rules
D2	Duplicates, dtypes, text cleanup	Fix column names; strip whitespace; standardize categories	Same course	Write a pandas snippet that standardizes these messy city names: [paste sample]
D3	Dates and times: to_datetime, dt	Extract month and year; filter date ranges	YouTube search: pandas datetime tutorial	Quiz me on the dt accessor with 5 questions

Day	Learn (60 min)	Build (45 min)	Resource / search query	AI shortcut
D4	Project setup	Pick a messy dataset (search: Pakistan rent or housing on Kaggle); plan cleaning steps in markdown	kaggle.com/datasets - search Pakistan rent	Here are my columns: [paste]. List the cleaning steps you would run
D5	Project: clean it	Execute every step; document each with a markdown note	Your notebook	Review my cleaning logic: [paste code]. Find mistakes and risks
D6	Project: analyze	GroupBy summaries, top-10 lists, price ranges; save the cleaned CSV	Your notebook	Turn these outputs into 5 bullet insights in simple English: [paste]
D7	Project: publish	GitHub repo with README, before/after screenshots; draft a LinkedIn post	github.com	Write a LinkedIn post announcing my first data project in simple English

> Day 28 checkpoint: SQL is comfortable, Python is functional, GitHub is alive, and the Pakistan-rent cleaning project is public.

4. Phase 2 - Analyst Toolkit (Weeks 5-8)

Phase 2 turns raw skill into analyst craft: the statistics that actually matter, professional exploratory analysis, and the two tools every analyst job in Pakistan names - Power BI and Excel. The phase ends with Portfolio Project 1 finished end to end: data pulled with SQL, cleaned in Python, delivered as a Power BI dashboard. That single artifact says more than any certificate.

4.5 Week 5 - Statistics That Actually Matter

Goal: learn the small set of statistics analysts use daily - averages, spread, outliers, correlation, distributions - and learn to explain them in business language. No proofs, no formulas memorized for their own sake.

Day	Learn (60 min)	Build (45 min)	Resource / search query	AI shortcut
D1	Mean, median, mode - and when the mean lies	Compute all three on your Week-4 cleaned data; explain the difference	YouTube search: StatQuest mean median mode	Explain why median income is more honest than mean, using a Lahore salary example
D2	Spread: standard deviation, quartiles, IQR outliers	Run describe() on your dataset; flag 3 suspected outliers	YouTube search: StatQuest boxplots	Give me 5 questions that detect outliers in sales data
D3	Correlation vs causation	Compute a correlation matrix; write 2 honest interpretations	YouTube search: correlation vs causation explained simply	Explain correlation vs causation with an ice-cream example, then a business example
D4	Distributions and skew	Plot histograms; describe what shape means for pricing decisions	YouTube search: StatQuest distributions	Here is my histogram summary: [paste]. Tell me the business story

Day	Learn (60 min)	Build (45 min)	Resource / search query	AI shortcut
D5	Sampling and bias	Read one short lesson; summarize bias types in 5 lines	khanacademy.org - statistics basics	Explain survey bias types using online-review examples
D6	Apply: stats section in your notebook	Add a statistics section with markdown insights to the Week-4 project	Your notebook	Check my statistics claims for beginner mistakes: [paste]
D7	Light day: cheat sheet	Write a one-page statistics cheat sheet in your own words	Your notes	Turn my cheat sheet into 10 flashcard questions and answers

Day 35 deliverable: a personal statistics cheat sheet pushed to GitHub - you will reuse it in interviews.

4.6 Week 6 - EDA and Visualization in Python

Goal: produce a professional exploratory data analysis (EDA) notebook - the standard first-round interview artifact - and learn chart design so your visuals inform instead of decorate.

Day	Learn (60 min)	Build (45 min)	Resource / search query	AI shortcut
D1	What EDA is; the reusable workflow	Create an EDA template notebook with section headers	kaggle.com/learn/data-visualization	Give me a 6-step EDA checklist I can reuse on any dataset
D2	matplotlib basics: bar, line, histogram	Make 4 charts from your cleaned data with titles and axis labels	Same course	Review my chart code: [paste]. How do I make labels readable?
D3	seaborn: distributions and categories	Boxplot, countplot and heatmap on your data	Same course	Which chart fits comparing 5 categories over time? Explain why
D4	Chart design rules	Fix yesterday's charts: titles as messages, sorted bars, no chartjunk	YouTube search: data visualization best practices	Critique my chart like a design lead: [describe axes, aim]
D5	Project 2 dataset exploration begins	Pick Project 2 data (e-commerce sales or retail); start the EDA notebook	kaggle.com/datasets - search e-commerce sales	Here are my columns: [paste]. Suggest 5 hypotheses worth testing
D6	Finish EDA with insights	Complete observations; write a summary in plain English	Your notebook	Write an executive summary from these findings: [paste]
D7	Light day: publish + post	Push the notebook; draft LinkedIn post number 2 with one chart	github.com	Write a simple LinkedIn post explaining this chart: [describe]

Day 42 deliverable: a complete EDA notebook public on GitHub, with at least one chart good enough for LinkedIn.

4.7 Week 7 - Power BI I - From CSV to Dashboard

Goal: get productive in Power BI Desktop (free): load data, shape it in Power Query, build core visuals, model simple relationships, and write your first DAX measures. This is the tool Pakistani corporates and banks ask for by name.

Day	Learn (60 min)	Build (45 min)	Resource / search query	AI shortcut
D1	Install Power BI Desktop; understand the interface	Load your cleaned CSV; click through every pane	learn.microsoft.com/power-bi - Get started path	Explain Power BI Desktop vs Service vs Mobile in simple words
D2	Power Query: cleaning inside Power BI	Apply 5 transformation steps; keep them documented	Same learning path	Map Power Query steps to pandas: give me a comparison list
D3	Core visuals: bar, card, slicer, map	Build your first sales overview page	YouTube search: Power BI dashboard for beginners full course	Suggest the best 5 visuals for a sales overview and why
D4	Data model: relationships, star schema basics	Connect 2-3 tables (orders, products, dates)	Same channel playlist	Explain star schema using a shop: orders, products, dates
D5	DAX basics: SUM, CALCULATE	Create 5 measures; use them in cards	YouTube search: DAX measures tutorial for beginners	Explain CALCULATE like I am 15, with a sales example
D6	Dashboard v1 assembly	Assemble a full page: title, KPIs, trend, breakdown	Your data	Critique my dashboard layout: [describe]. What would you move and why?
D7	Light day: gallery study	Explore 5 dashboards in the Power BI community gallery; note 3 designs you like	community.powerbi.com - Galleries	-

> Day 49 deliverable: Project 1 draft dashboard (e-commerce sales) running in Power BI Desktop.

4.8 Week 8 - Power BI II, Excel, and Project 1 Complete

Goal: finish Portfolio Project 1 to a standard you can show a recruiter, add time intelligence and interactivity, and cover the Excel skills (pivots, lookups) that interviews still test. This is the week your proof becomes undeniable.

Day	Learn (60 min)	Build (45 min)	Resource / search query	AI shortcut
D1	Time intelligence: YoY, MoM	Add year-over-year and month-over-month measures	YouTube search: Power BI time intelligence DAX	Explain SAMEPERIODLASTYEAR with a simple sales example
D2	Tooltips, drill-down, bookmarks	Add interactivity: tooltip page, drill-through, 2 bookmarks	Same playlist	Give me 5 ideas that make a sales dashboard feel interactive

Day	Learn (60 min)	Build (45 min)	Resource / search query	AI shortcut
D3	Excel for analysts: pivot tables	Rebuild one dashboard summary as an Excel pivot	YouTube search: Leila Gharani pivot tables	When is Excel better than Power BI? Give 3 client scenarios
D4	XLOOKUP / VLOOKUP + chart polish	Practice file: 5 lookup exercises + one clean chart	YouTube search: XLOOKUP tutorial	Give me 5 Excel interview exercises with answers
D5	Project 1 finalization	Write the README, export screenshots, record a 2-minute walkthrough video	github.com	Give me a reusable project README template (problem, data, steps, insights)
D6	Portfolio day	Update LinkedIn: About, Featured section, pinned repos	linkedin.com	Write my LinkedIn About section: aspiring data analyst, final-year CS, projects listed
D7	Light day: phase review	Self-quiz across weeks 5-8; list weak spots for weekend review	Your notes	Quiz me on weeks 5-8: 15 questions, one at a time, grade each answer

> Day 56 checkpoint: Project 1 is live (SQL + Python + Power BI + README), Excel basics work, and your LinkedIn profile no longer looks empty.

5. Phase 3 - Portfolio and Income Launch (Weeks 9-12)

Phase 3 converts skill into proof, profiles and applications. You will build a second project in a different domain, open Fiverr and Upwork for business, add Tableau and Kaggle for breadth, and fire off your first real wave of job applications. From this week forward, sending proposals and applications is part of the plan itself - not something you start after feeling ready, because ready is a feeling that arrives only after volume.

5.9 Week 9 - Project 2 and Profile Polish

Goal: a second, different-domain project so your portfolio shows range, plus a CV and GitHub profile that survive a 30-second recruiter skim. Two projects in different domains beat five projects in the same domain.

Day	Learn (60 min)	Build (45 min)	Resource / search query	AI shortcut
D1	Choose Project 2 domain (HR analytics, rentals, retail - different from Project 1)	Shortlist 3 datasets; pick one and justify the choice	kaggle.com/datasets	I have 3 project ideas: [paste]. Rank them by job-market value and explain
D2	SQL layer	Load the data into MySQL; write 10 analysis queries; save them	Your MySQL	Review my SQL for best practices: [paste 3 queries]

Day	Learn (60 min)	Build (45 min)	Resource / search query	AI shortcut
D3	Python layer	Clean and explore in a notebook; document decisions	Your notebook	Check my cleaning steps for silent mistakes: [paste]
D4	BI layer	Build the Project 2 dashboard in Power BI	Power BI Desktop	Critique my dashboard: [describe pages and visuals]
D5	GitHub polish	Profile README, pinned repositories, screenshots on both projects	github.com	Write my GitHub profile README: aspiring data analyst, 2 projects, learning in public
D6	CV day	Draft a one-page CV: skills, 2 projects with metrics, education, FYP in one line	A free template (Canva or Overleaf)	Rewrite my CV bullets in action-plus-result format: [paste bullets]
D7	Light day: publish + post	LinkedIn post number 3 introducing Project 2	linkedin.com	Improve the hook of this post: [paste draft]

> Day 63 deliverable: Project 2 live, GitHub profile polished, one-page CV drafted.

5.10 Week 10 - Freelance Launch Week (Fiverr + Upwork)

Goal: go from invisible to open for business. By Sunday you will have three live Fiverr gigs, a complete Upwork profile, and your first ten proposals out the door. Chapter 6 is the detailed manual for this week - keep it open beside you.

Day	Learn (60 min)	Build (45 min)	Resource / search query	AI shortcut
D1	Fiverr profile + Gig 1 (data cleaning)	Publish profile and first gig using the Chapter 6 checklist	fiverr.com - seller onboarding	Write my Fiverr gig description for data cleaning: title, description, 5 search tags
D2	Gig 2 (Power BI dashboard)	Create gig images in Canva; publish second gig	canva.com (free)	Give me 3 gig-image text ideas that get clicks for a beginner
D3	Gig 3 (web scraping) + pricing	Publish third gig; review all pricing tiers	Your Fiverr dashboard	Is my beginner pricing sane coming from Pakistan? Suggest 3 tiers per gig
D4	Upwork profile to 100 percent	Title, overview, portfolio items, hourly rate	upwork.com - freelancer onboarding	Write my Upwork overview: beginner, honest, specific, no cliches
D5	First 10 proposals	Send 10 proposals using the Chapter 6 template, personalized per job	upwork.com - job feed	Tailor my proposal to this job post: [paste post] (repeat for 3 posts)
D6	LinkedIn push	Headline, banner, Featured section; connect with 10 working analysts	linkedin.com	Write a short, genuine connection note to a senior data analyst
D7	Light day: pipeline setup	Set response-time expectations; list 5 local companies to target for internships	Your notes	List fintechs, banks and software houses in my city that hire data interns

> Day 70 deliverable: 3 gigs live, Upwork profile complete, 10 proposals sent, local target list written.

5.11 Week 11 - Kaggle and Tableau Week

Goal: breadth and credibility. A Kaggle submission shows you can work inside a competition workflow; Tableau makes you conversant in the second-biggest BI tool, which matters for multinational and remote roles. Both in one week, without perfectionism.

Day	Learn (60 min)	Build (45 min)	Resource / search query	AI shortcut
D1	Kaggle basics + pick a beginner competition	Join one; submit a trivial baseline (even a mean prediction counts)	kaggle.com/competitions	Explain this competition's goal and evaluation metric in simple words
D2	Improve the submission	Read 2 public notebooks; apply one idea; resubmit	Same competition	Explain this public notebook cell line by line: [paste cell]
D3	Tableau Public install + interface	Load a CSV; build bar, line and map charts	tableau.com/products/public (free)	Tableau vs Power BI for freelancing: give me 3 honest points
D4	Rebuild Project 1 dashboard in Tableau	Recreate the main page; note what is easier and harder	YouTube search: Tableau tutorial for beginners	Map my Power BI measures to Tableau equivalents: [paste measures]
D5	Publish to Tableau Public	Publish the viz; add the link to GitHub and LinkedIn	public.tableau.com	Write a short Power BI vs Tableau comparison note for my README
D6	Proposal push number 2	Send 10 more proposals; follow up on week-10 conversations	upwork.com + fiverr.com	Write a polite follow-up for a client who viewed my proposal but did not reply
D7	Light day: rest + quiz	Mixed review, 30 minutes maximum	Your notes	Quiz me: 10 mixed questions across SQL, Python and BI

> Day 77 deliverable: one Kaggle submission, a Tableau Public profile with a live viz, and 20 total proposals sent.

5.12 Week 12 - Applications and Interview Prep

Goal: finish the ninety days in motion - CV finalized, twenty-plus applications out, interview patterns practiced out loud, and a concrete plan for the next thirty days. The goal is not to have a job on day 90; it is to be in active pipelines on day 90.

Day	Learn (60 min)	Build (45 min)	Resource / search query	AI shortcut
D1	CV final + Open to Work (recruiters only)	Polish the CV; match it to 2 real job descriptions	Your CV file	Tailor my CV to this junior analyst job description: [paste JD]
D2	Application wave 1	Apply to 10 internship or junior roles: LinkedIn, Rozee.pk, Indeed PK	rozee.pk + linkedin.com/jobs	Write a 3-line application note for this role: [paste role]
D3	Application wave 2 + outreach	Apply to 10 more; message 5 alumni or recruiters politely	linkedin.com	Draft a short recruiter message about an intern data role
D4	SQL interview practice	Solve 5 questions speaking your reasoning out loud	stratascratch.com - free questions	Mock interview me: 5 SQL questions, one at a time, grade my answers
D5	Project storytelling + case questions	Prepare a 2-minute story per project; practice 5 case questions	Your project notes	Ask me 5 questions about my projects and rate my answers honestly
D6	Project 3 or React bonus start	Start Chapter 8's weekend build, or polish the weakest portfolio piece	See Chapter 8	Plan my React plus Python API dashboard weekend build
D7	Day-90 review	Score yourself against the Chapter 9 milestones; write the next-30-day plan	Chapter 9 tables	Here are my 90-day results: [paste]. Suggest my next-30-day plan

> Day 90 checkpoint: 20+ applications sent, interview practice done, and a written plan for the next 30 days.

6. Freelance Launch Kit: Fiverr and Upwork

Freelancing is the fastest income door for a beginner in Pakistan because the gate is a good profile and persistent proposals, not HR filters and experience requirements. This chapter is the manual for week 10 and for every week after: set up once, then run the volume machine. Expect silence at first - the first order typically arrives after dozens of proposals, and that is normal, not failure.

6.1 Fiverr: three gigs, set up in three days

Fiverr works opposite to Upwork: buyers search and come to you, so your gigs must match what people actually type. Pick services where your day-60 skills are already real: data cleaning, Power BI dashboards and web scraping. Use a clear photo of your face, a bio stuffed with honest keywords (SQL, Python, Power BI, data cleaning, dashboards), and answer messages fast - response time affects ranking.

Gig	Title on Fiverr	Start price	Extras to offer
1	I will clean and analyze your data with Python or Excel	USD 10	+15 for charts and a short report; +30 for 24-hour delivery
2	I will build an interactive Power BI dashboard from your data	USD 25	+20 for an extra dashboard page; +30 for DAX measures and filters

Gig	Title on Fiverr	Start price	Extras to offer
3	I will scrape any website into Excel or CSV with Python	USD 15	+10 for an automation script; +20 for scheduled runs

Gig images decide whether anyone clicks: make them in Canva (1280 by 769 pixels), dark text on a clean light background, one benefit per image, no clip-art. Fiverr keeps 20 percent of everything you earn and pays out through Payoneer, which transfers to Pakistani banks. Start cheap on purpose: your first ten orders buy you reviews, and reviews - not talent - are what rank gigs.

6.2 Upwork: the proposal machine

Upwork is the opposite game: you bid, so volume and personalization win. Complete your profile to 100 percent (photo, title Data Analyst | SQL, Python, Power BI, overview, portfolio screenshots, education, hourly rate USD 10-15), use your free monthly Connects plus any earned Connects, and send five to ten tailored proposals every weekday. Expect fifty to a hundred proposals before the first order; every send is a ticket in a lottery you eventually win. Upwork's service fee is a flat 10 percent on earnings.

6.3 The proposal template that gets read

Clients skim the first two lines. Lead with their problem, not your biography. The template:

Slot	What to write
Line 1 - their problem	You need [what they asked] by [their deadline / this week], without [their pain point].
Line 2 - your proof	I recently built [closest thing you made]: [one-line result + link to GitHub or a screenshot].
Line 3 - your plan	My plan: (1) [step one], (2) [step two], (3) [step three] - delivered in [X] days.
Line 4 - a smart question	One question so I do this right: [a question that shows you understood their business].
Sign-off	Name, hours available this week, and a thank-you. Nothing else.

> Worked example for a dashboard job: You need a sales dashboard in Power BI by Friday so your team stops making decisions from raw Excel dumps. I recently built a full e-commerce sales dashboard (KPIs, trends, drill-down) - screenshots here: [link]. My plan: (1) load and model your data in Power Query, (2) build the KPI and trend pages, (3) hand over with a 5-minute walkthrough video - in 3 days. Should the dashboard refresh from your Excel file manually, or do you want a scheduled refresh? - Ahmed, available 4 hours daily this week. (Use your own name.)

6.4 First-order playbook and getting paid

- Under-promise and over-deliver: finish a day early and add one small free improvement - that is what five-star reviews are made of.
- Ask for the review politely right after delivery, while the good feeling is fresh.

- Upsell in the same conversation: a cleaning client needs a dashboard; a dashboard client needs a refresh schedule.
- Raise prices by USD 5 after every 3-5 orders; do not race to the bottom forever.
- Money rails for Pakistan: Fiverr pays out via Payoneer, Upwork via Payoneer or Wise (direct-to-bank); keep everything priced in USD.
- Track every proposal in a simple sheet: date, job link, sent, replied, won. What gets measured gets improved.

6.5 The local parallel track

Run jobs and freelancing in parallel - they reinforce each other. Internships at banks, fintechs, telcos and software houses typically pay PKR 25,000-60,000 per month, and junior analyst roles pay PKR 50,000-100,000. Search Rozee.pk, LinkedIn Jobs and Indeed Pakistan daily in week 12 and after, and use your university placement cell. Apply even when the ad says two years of experience: your GitHub and dashboards are your experience, and in this market a strong portfolio regularly beats the checkbox.

7. The AI Shortcut Library

These ten prompts are the accelerators referenced throughout the weekly tables. Copy them into any capable free AI assistant (ChatGPT, Claude, Gemini) and replace the bracketed parts. They are written to teach, not to do your work - each one keeps you in the loop, because the person who must perform in the interview room is you.

> The golden rule: AI explains, you re-do. Whatever AI helps you build, rebuild the core of it from memory within 24 hours. If you cannot re-do it, you have not learned it - you have collected it.

1. Concept Explainer

Use it when: When a definition will not stick.

```
Explain [topic] like I am 15, using an example from [Daraz online sales / cricket scores / a Pakistani bank]. Then give me a 3-question quiz and wait for my answers.
```

2. Hint-Only Tutor

Use it when: When you are stuck and tempted to look at solutions.

```
I am stuck on this problem: [paste problem and your attempt]. Do NOT give the solution. Give me exactly one hint and wait for my next attempt.
```

3. Error Decoder

Use it when: When a red error wall appears.

```
Here is my error and my code: [paste both]. Explain (1) what the error actually means, (2) the minimal fix, (3) how to avoid this class of error next time.
```

4. Senior Code Reviewer

Use it when: When your code works but feels ugly.

```
Review this notebook like a strict senior analyst: correctness, readability, and one performance improvement. Be harsh but specific: [paste code]
```

5. Messy Dataset Generator

Use it when: When you need practice data that feels real.

```
Generate a messy CSV of 200 rows simulating a Karachi grocery shop's monthly sales: missing values, spelling mistakes, duplicate rows, mixed date formats. Then list exactly what problems you planted so I can practice cleaning them.
```

6. Interview Quiz Master

Use it when: Daily 15-minute drills and pre-interview warmups.

```
Give me 10 interview questions on [topic], ordered easy to hard. Ask one at a time, grade each of my answers out of 10, then show the model answer.
```

7. Chart Critic

Use it when: Before any chart goes into a project or a LinkedIn post.

```
I built this chart: [describe chart type, axes, and what it should show]. Critique the title, labels, chart-type choice and colors. Suggest a better alternative if mine is wrong.
```

8. README and Post Writer

Use it when: Publishing day - turning raw work into a story.

```
Turn these project notes into a GitHub README in simple English: [paste notes]. Sections: problem, data, cleaning steps, analysis, insights, screenshot placeholders. Keep sentences short.
```

9. Proposal Tailor

Use it when: Every single Upwork application.

```
Here is a job post: [paste post]. Write a 5-sentence proposal: restate their problem, one line of proof from my projects, a 3-step plan, and one smart question. Tone: confident beginner, zero fluff.
```

10. Mock Interviewer

Use it when: Week 12 and before every real interview.

```
Run a 20-minute junior data analyst interview: 5 SQL, 3 Python, 3 dashboard, 2 behavioral questions. Ask one at a time, grade each answer 1-10, and give feedback after each.
```

8. Bonus Track: The BI Developer Combo (React + Data)

You already own a skill most analysts lack: building interfaces. Add it to the data layer and you become a BI Developer or junior Analytics Engineer - a rarer and better-paid profile than a pure analyst, and one where your non-standard FYP finally helps instead of hurts: it is web experience, and now it sits next to real data work. This track is optional and scheduled after the core ninety days (or in the day-7 light slots of weeks 11-12 if you are ahead of every checkpoint). Do not let it eat your SQL and Power BI hours before day 90.

8.2 The weekend build: Project 3, the live dashboard

One focused week of day-7 sessions (or one weekend) turns your cleaned data into a living product. The stack is deliberately small: a Python API serving aggregated data, and a React frontend charting it. You already know React and Node; only the API is new, and it is a small step from MySQL queries you wrote in week 1.

Step	Build	Notes
1	**Python API: Flask or FastAPI with 2-3 endpoints**	Endpoints like /api/sales-by-month reading from your cleaned CSV or MySQL; test in the browser first
2	**React app scaffold (Vite) with two pages**	Dashboard page + insights page; keep routing minimal
3	**Charts with Recharts**	Bar chart, line chart, one filter dropdown (city or category); fetch from your API
4	**Design pass**	One accent color, clear titles as messages, responsive layout - reuse what you learned about chart design in week 6

Step	Build	Notes
5	**Deploy free**	Frontend on Vercel or Netlify; API on Render's free tier (or commit a JSON snapshot if hosting fights you)
6	**Publish the story**	README with architecture sketch and screenshots; LinkedIn post: from database to dashboard

8.3 Where it leads

With the combo live, your pitch changes from I am learning data analysis to I build the data pipeline and the product around it. That sentence matches BI Developer, Analytics Engineer and data-product intern postings, and it differentiates you in freelance bids too - dashboard clients love someone who can also wire the app. Long term this path scales toward analytics engineering and data platform roles, which are among the healthiest segments of the data market.

9. Tracking, Milestones and Life After Day 90

What gets measured gets finished. This chapter is your control panel: a weekly self-review you run every day 7, milestone gates for day 30, 60, 90 and 180, and the three paths that open after the plan. Print this chapter or keep it bookmarked - it is the part you will actually reread.

9.1 The weekly self-review (every day 7)

#	Ask yourself	Pass condition
1	Did I study at least 6 days this week?	6 of 7 days, even if two were 1-hour days
2	Did I solve SQL or Python problems from memory?	At least 10 problems without peeking
3	Did something new land on GitHub?	At least 1 push: repo, notebook or README update
4	Can I explain this week's main concept out loud?	A 2-minute explanation with no notes
5	Did I send proposals or applications (from week 10 on)?	5+ per week minimum
6	Did I do one LinkedIn action?	A post, a comment, or 5 new relevant connections
7	Did I use AI to review my work?	At least 3 prompt sessions, with re-dos
8	Did I fix last week's weak spot?	The thing you flagged last week is closed
9	Is my backlog zero?	No unfinished day carried into the new week
10	Do I know exactly what Monday's D1 is?	Written down, not remembered

9.2 Milestone gates

Gate	Must be true	Red flags (fix before continuing)
Day 30	40+ SQL problems solved; Python basics working; 2 repos on GitHub; HackerRank SQL badge	Only videos watched; GitHub empty; SQL still needs notes for JOINs
Day 60	Project 1 live end to end; statistics cheat sheet done; EDA notebook public; LinkedIn updated	No finished project; dashboards exist only as tutorial clones
Day 90	2-3 portfolio projects; 3 Fiverr gigs live; 20+ proposals sent; 20+ applications; Tableau viz published; Kaggle submission done	Waiting to feel ready before applying; profiles still empty; zero proposals sent
Day 180	First recurring freelance income or internship/junior role; interview invitations arriving; React combo project live (optional track)	Income at zero AND proposals stopped; application pipeline dry

9.3 Three paths after day 90

Path A - the job track: keep applying weekly, tailor the CV per posting, and convert interviews using your project stories; target internships and junior analyst openings at banks, fintechs, telcos and software houses. Path B - the freelance track: raise gig prices every few orders, specialize (Power BI dashboards for e-commerce, say), and let reviews compound into USD 500+ months; many freelancers in Pakistan reach this within a year of consistent bidding. Path C - the combo track: finish Chapter 8, pitch BI Developer and analytics-engineer openings, and let the double skill do the differentiating. None of these paths are exclusive; the strongest run job and freelance tracks together until one clearly wins.

9.4 The one rule that decides everything

Ninety days from now, the difference between the person who made it and the one who did not will not be talent, tutorials or talent-adjacent luck - it will be showing up six days a week for two hours and refusing to stop sending proposals after silence. The market rewards visible, finished work and persistent volume. You now have the map, the daily tables, the AI accelerators and the income playbook. Day 1 is SQLBolt lesson 1. Start today, and let day 90 look back at a person who kept a simple promise: two hours, every day.
